

C.N.S ELECTRONICS LTD

The PUNDIT Ultrasonic Test equipment has been successfully used in the investigation of ultrasonic propagation characteristics of rocks under uniaxial compression.

The photograph illustrates the Pundit itself, a P&S Wave transducer (1 MHz - 2" diameter) capable of sustaining loads of 220 kN (22 tons). By means of the switch unit, time of flight for either shear or compression waves may be read out on the Pundit. In addition, the wave form may be studied simultaneously by employing the CRO output from the Pundit and if attenuation measurements are desired, the Add-on CRO Unit with built in compression attenuators, may be connected to the equipment.

Additionally, a 100 ton, compression wave, transducer (54 kHz of 4" diameter) is also available. In the inset, the shear wave is displayed, and in the photograph itself, the compression wave.

CNS are indebted to Professor Michael S. King of the Department of Geological Science of the University of Saskatchewan for the original concept of these transducers.

Geological Background to Fossil Man

Special Publication of the Geological Society, Number 6
edited by the late W.W. Bishop

Recent research in the Gregory Rift Valley in East Africa has been concerned with palaeontological and archaeological problems and it has included some remarkable hominid discoveries. This important book describes the broad structural, volcanic and geophysical aspects of the area, and gives an outline of the history and the development of the Valley. The text provides detailed regional studies of four sections of the Gregory Rift, and includes an account of the setting of the next hominid discoveries in Afar.

Outline of Contents: Frameworks: structural-volcanic-geophysical; Background: palaeontological and archaeological problems; Regional studies in the Gregory Rift Valley: Olduvai Gorge and Laetolil, Tanzania; Olorgesallie, Kenya; The Lake Baringo Basin, Kenya; The Lake Turkana (Rudolph) Basin, Kenya and Ethiopia; The Afar area, Ethiopia.

1978. 608 pages, 182 illustrations. £25.00 net

Other Special Publications still available

No. 1 Phanerozoic Time Scale £8.25

No. 2 The Fossil Record £9.05

No. 4 Mesozoic-Cenozoic Orogenic Belts £30.00

No. 5 Phanerozoic Time Scale (Supplement) £8.55

No. 7 Volcanic Processes in Ore Genesis £11.00

MARINE Geotechnology

*An International Journal
of Seafloor Science and Engineering*

Edited by Adrian F. Richards
Lehigh University

This quarterly journal publishes research studies devoted to all scientific and engineering aspects of seafloor sediments and rocks. It examines the acoustical, biological, chemical, mechanical and physical properties affecting the electrolyte-gas-solid sedimentary system of the seafloor.

Contents, Volume 4, Number 2:

- Undrained Creep Characteristics of Deep-Ocean Sediments •
- Variation of Sediment Geotechnical Properties Between the Greater Antilles Outer Ridge and the Nares Abyssal Plain •
- Pore-water Pressure Change in Submarine Sediments due to Waves •
- Investigation of Geotechnical and Geochemical Relationships by Parameter Cross-Correlation Methods, Oslofjorden and Dramsfjorden, Norway.

Issued Quarterly: Volume 4 \$48.00

International Journal of Engineering Science

(Incorporating Letters in Applied and Engineering Sciences)

Editor-in-Chief: A C ERINGEN, *Princeton University*

Original research pertaining to the application of the physical, chemical and mathematical sciences to engineering is published in this journal. Highest priority is given to those contributions concerned with the cross-fertilization of these fields, and research in the coupled regions of mechanics, electricity and magnetism, thermodynamics and physical chemistry, both from continuum and molecular points of view. Applied research articles are included in such interdisciplinary areas as biomechanics, system theory, energy and approximation theory as applied to basic problems in engineering science.

Recent papers include:

A CHAURÉ, Nonlinear stability of the motion of a nematic liquid crystal.

J L AURIAULT, Dynamic behaviour of a porous medium saturated by a Newtonian fluid.

J H PRÉVOST, Mechanics of continuous porous media.

J ABOUDI and S R BODNER, Dynamic response of a slab of elastic-visco-plastic material that exhibits induced plastic anisotropy.

Y BENVENISTE, One-dimensional wave propagation in materials with different moduli in tension and compression.

D L JAIN and R P KANWAL, Scattering of elastic waves by an elastic sphere.

A KADIĆ, Aspects of Cauchy elastic materials.

Geoscience Texts

'In a spirit of enterprise, Blackwell Scientific has launched a series of "Geoscience Texts", aimed at student courses on single subjects. The slow moving, compendious geology volume has given way to a new breed of faster, lighter, glossy paperbacks. . . . From the evidence so far the venture is successful: the books are slim and attractive, the prose is fresh, the lay-out appealing. Two of the three titles reflect necessary changes in the content of courses as geologists are required to learn those crafts most in demand from the commercial world: ore geology for mineral exploitation, and sedimentary petrology for petroleum exploration.'

Robert Muir Wood, *New Scientist* November 1980

Volume 1

Principles of Mineral Behaviour

A. Putnis & J.D.C. McConnell. 1980. 272 pages, 212 illustrations. Cloth £18.00, paper £9.80

Volume 3

Sedimentary Petrology: an Introduction

M.E. Tucker. 1981. 252 pages, 180 illustrations. Paper £8.50

Of related interest

Economic Geology and Geotectonics

Edited by Don H. Tarling. 1981. 242 pages, 63 illustrations. £15.00

With an increasing awareness of the finiteness of ore reserves and hence of the need for increasingly sophisticated, and expensive, exploration techniques, economic geology has emerged as a fruitful discipline. Although primarily concerned with the impact of new tectonic theories on economic geology, this book is also intended to provide a general introduction to the processes of the geological concentration of petroleum, oil and ore deposits.

Volume 2

An Introduction to Ore Geology

Anthony M. Evans. 1980. 248 pages, 130 illustrations. Cloth £16.00, paper £7.50

In Preparation

Structural Geology Applied Geophysics Palaeoecology

Contents

Introduction: plate tectonics *D. H. Tarling*

Petroleum: introduction and source rocks
R. Stoneley & R. J. Bailey

Petroleum: basins *R. Stoneley*

Petroleum: reservoirs and conclusions *R. J. Bailey & R. Stoneley*

Coal *G. A. L. Johnson*

Ore deposits of the ocean crust *J. R. Cann*

Ore deposits associated with subduction
R. D. Beckinsale & A. H. G. Mitchell

Ore deposits in sedimentary rocks *J. P. N. Badham*

Palaeoclimatic considerations and general conclusions *D. H. Tarling.*

Blackwell Scientific Publications

NOTES FOR THE GUIDANCE OF AUTHORS

General: The instructions below should be followed. Further advice on particular points may be obtained from the Publications Secretary, Geological Society, Burlington House, LONDON W1V 0JU, U.K.

Papers are accepted on the understanding that they have not been submitted or published elsewhere and become copyright of the Geological Society.

Papers on major topics of international interest in engineering geology are welcomed; those of local interest are unsuitable. Short topical papers of 4 pages or less will be published quickly. The average length for papers, including references and text-figures, is 9 pages.

There are c. 900 words on a printed page.

Three complete copies should be sent to the Publications Secretary (recorded delivery in the U.K., registered post from elsewhere). Typescripts must be accurate and in their final form. Owing to the high cost of corrections at proof stage, the editors will charge authors the full cost of excessive corrections resulting from inaccurate typescripts. Afterthoughts and additions at proof stage will not be allowed. Papers (including references) must be submitted in the style and layout used in the Journal (see current Parts). Those which do not comply will be returned to the author for modification. Typescripts should be double-spaced, including references, on one side of the paper only with a 2.5 cm margin on each side. A4 paper is preferred. All pages should bear the author's name and be numbered serially.

Papers should be succinct; figures, tables and half-tone plates should be kept to a minimum. Papers should be arranged as follows:

1. Title, brief and specific.
2. List of contents (only in the case of long complex papers).
3. Summary: this must be intelligible without reference to the paper, and should not exceed 200 words (100 words for short papers). It should be a condensation of the essential new information and interpretations in the paper, and not a mere recital of the subjects covered.
4. Main body of paper, subdivided into 1st, 2nd, 3rd and 4th order headings (as necessary); avoid heading 'Introduction'.
5. Appendices (See Supplementary Publications below).
6. References (see below), followed by the full name(s) and address(es) of author(s). When there is more than one author, state to whom proofs and offprint order forms should be sent.
7. Tables, each typed on a separate sheet.
8. Legends for text-figures and plates (if any).

References: The author is responsible for ensuring that the references are correct and that Journal abbreviations comply with those in the *List of Serial Publications held in the Library of the Geological Society of London* (Geological Society, 1978). List only those references cited in the text. Reference in the text to papers with more than two authors should be made thus: (Smith *et al.* 1978) but cited in full in the References.

Illustrations: Send only photocopies, retaining the originals until the Editor in charge or the Publications Secretary asks for them. Indicate the suggested size for reproduction. Originals should bear the author's name, and TOP should be indicated.

Drawings should be in black on white card or a colourless tracing medium. A metric scale should be included, and north point (or where relevant, coordinates of latitude and longitude, or National Grid) on all maps. Lettering should be no less than 2 mm high after reduction. Maximum page area is 203 × 155 cm. The page format should be considered in designing text-figures.

Large folding figures and coloured maps are subject to rigorous scrutiny and will be accepted only in special cases or when publication is assisted by a subvention.

Offprints may be ordered, on the form provided, at proof stage. 50 free copies are supplied. These are divided amongst authors for multi-author papers.

Discussion of papers: Short discussions (maximum 500 words) on papers which have already appeared in the Journal are acceptable. Two copies should be submitted; the title and author(s) of the paper discussed should be clearly indicated.

Supplementary Publication: Limited space in the Journal, rising costs of printing, and improved copying methods mean that detailed material (e.g. in appendices) will be made available in the form of Supplementary Publications. Such items include locality lists, tables of chemical and other analyses, details of techniques, stratigraphic sections, photographs and photomicrographs, maps, cross-sections, borehole data, mathematical derivations, computer printouts. These will be stored at the British Library Lending Division, Boston Spa, U.K., and the Library of the Geological Society, and made available as xerox copies or microfiches upon payment by prepaid coupons (consult librarians) or by payment to the Society. Sections of typescript suitable for such deposition may be indicated by authors and may be recommended by editors and referees.

Typescripts, enquires concerning editorial matters, layout, and all correspondence should be addressed to: The Publications Secretary, Quarterly Journal of Engineering Geology, Burlington House, LONDON W1V 0JU, U.K.
